

IN THE CLAIMS

Please amend the claims as follows:

Claims 1-5 (Canceled).

Claim 6 (Currently Amended): A display device, comprising:
a pixel array unit having display elements formed in vicinity of intersections of signal lines and scanning lines arranged in length and breadth, image pickup units and an output unit which outputs binary data corresponding to image picked up by said image pickup unit;
a image pickup device provided separate from said image pickup unit;
a first image processing unit configured to generate multiple gradation data based on multiple binary data picked up by said image pickup units based on multiple image pickup conditions; [[and]]
a second image processing unit configured to receive either the image pickup data picked up by said image pickup device or the multiple gradation data generated by said first image processing unit, to conduct a prescribed image processing;
a display controller IC which embeds said first image processing unit and supplies digital pixel data for said pixel array unit to said pixel array; and
a temporary storage capable of storing image pickup data of said image pickup unit for three horizontal lines,
wherein said pixel array unit is formed on an insulation substrate using TFTs (Thin Film Transistors); and
said first image processing unit is a semiconductor chip.

Claims 7-11 (Canceled).

Claim 12 (Currently Amended): The display device according to claim [[11]] 6,
wherein said virtual image pickup detector averages the four image pickup data, to calculate
the central image data.

Claim 13 (Currently Amended): The display device according to claim [[11]] 6,
further comprising a temporary storage capable of storing image pickup data of said image
pickup unit for three horizontal lines,

wherein while said first image processing unit is transmitting the image pickup data
stored in said temporary storage to said second image processing unit, said virtual image
pickup data detector calculates the central image pickup data, and transfers the calculation
result to said temporary storage.

Claim 14 (Currently Amended): A display device, comprising:
display elements in pixels formed in vicinity of intersections of signal lines and
scanning lines disposed in length and breadth;
image pickup units, at least one of said image pickup units being provided
corresponding to each pixel, and each conducting image pickup at a prescribed range;
binary data storages which store binary data corresponding to results of image picked
up by said image pickup unit, [[and]]
an averaging gradation estimation unit configured to estimate an averaging gradation
of whole display screen based on the binary data of the pixels connected to a portion of the
scanning lines which do not neighbor to each other;

an insulation substrate on which said display elements, said image pick units and said binary data storages are formed; and

a backlight device capable of alternately illuminating lights of white, green and blue, said backlight device being disposed on back face,

wherein said averaging gradation estimation unit estimates averaging gradation based on the binary data picked up by said image pickup unit with respect to illumination colors of said backlight device.

Claims 15-19 (Canceled).

Claim 20 (Currently Amended): A display device, comprising:
display devices in pixels formed in vicinity of intersections of signal lines and scanning lines disposed in length and breadth;
image pickup units, at least one of said image pickup units being provided corresponding to each pixel, and each conducting image pickup at a prescribed range;
binary data storages which store binary data corresponding to results of image picked up by said image pickup unit;
a multiple gradation data generator which generates multiple gradation data with first, second third colors based on the binary data with the first, second and third colors picked up by said image pickup unit; and
a color composition unit configured to generate image pickup data with a fourth color based on the multiple gradation data with the first, second and third colors,
wherein said first, second and third colors are colors except red color, and the fourth color is red.

Claim 21-22 (Canceled).

Claim 23 (Original): The display device according to claim 20, wherein the first color is white, the second color is green and said third color is blue, and said color composition unit calculates the multiple gradation data with red color based on the multiple gradation data with white, green and blue.

Claim 24 (Original): The display device according to claim 20, further comprising a backlight device capable of alternately illuminating the lights with the first, second and third colors, said backlight device being disposed on back face of an insulation substrate on which said display elements and said image pickup units are provided, wherein said image pickup unit repeatedly conducts image pickup with respect to the first, second and third colors of said backlight device.

Claim 25 (Original): The display device according to claim 20, wherein said image pickup unit repeatedly picks up the image on multiple image pickup conditions with respect to the first, second and third colors of said backlight device; and said image pickup unit repeatedly picks up image with respect to the cases where illumination color of said backlight are the first, second and third colors.

Claim 26 (Original): The display device according to claim 20, wherein each pixel is substantially square shape.

Claim 27 (Original): The display device according to claim 20, further comprising an averaging gradation estimation unit configured to estimate the averaging gradation of the whole display screen based on the binary data of the pixel data connected to a portion of the scanning lines which do not neighbor to each other and a portion of the signal lines which do not neighbor to each other.

Claim 28 (Original): The display device according to claim 20, further comprising:
a signal processing output circuit which converts the binary data for multiple pixels into serial data; and

an output determination unit configured to determine whether or not to output the image pickup data of the remaining image pickup unit from said signal processing output circuit based on the estimation result of said averaging gradation estimation unit.
